Flawless preservation meets energy optimisation

Our smart module secures the ideal climate while actively reducing unnecessary energy consumption

Object-level insight for conservators

Most climate hardware is built for HVAC teams — not for conservators, archivists, and church wardens. You balance fragile collections against energy mandates without object-level proof, while building-wide sensors miss the vitrine, the nave, and the loan you never get to inspect.

HOW ROOMALYZER SOLVES IT

The specific analysis tools you need. The standards you trust.

Stop guessing and start optimising. RoomAllyzer Preservation provides specialised analysis tools and turns wireless [Humidity](#) and [Mini+](#) sensor readings (with [Outdoor](#) for façades) into zoned dashboards, drift alerts and audit-ready reports — so you can balance flawless preservation with energy efficiency. Battery life

PREDICTIVE

Mould risk (VTT)

Advanced predictive modelling to identify and prevent mould growth before it threatens your assets.

COMPLIANCE

Bizot Green

Compliance scoring against the Bizot Green protocol — temperature, humidity and fluctuation bands in one report.

COMPLIANCE

ASHRAE

THE CHALLENGES YOU KNOW

When you cannot prove the climate, every object is at risk.

Invisible gradual damage

Unfavourable humidity and temperature harm irreplaceable objects long before any visible sign appears — by the time cracking, warping or mould shows, the damage is already done.

No documentation of conditions

You cannot prove the climate your collection has been kept in — for insurers, funders, or conservation requirements — when readings live in notebooks or not at all.

Preservation versus energy bills

Heating a historic building to protect its contents is expensive, and without data you cannot find the balance between safeguarding collections and controlling running costs.

WHO IT IS FOR

For conservators and facility teams — with data everyone can trust.

The same objective climate baseline serves the conservator protecting the collection and the facility manager running the building.

For conservators and specialists

- ✓ Monitor RH and temperature at collection level
- ✓ Document conditions for EN 15757, insurers and funders
- ✓ Trust high-precision readings conservators require

For facility managers

- ✓ Balance preservation with heating and energy costs
- ✓ Get early warnings when HVAC drifts off setpoint
- ✓ Share the same data with conservation teams

See climate history for every display case and storage zone

Deploy without WiFi across thick-walled historic buildings

SMARTER TOGETHER

Pair preservation monitoring with live indoor-climate data for occupied spaces.
