Smart water detection. Get the message, not the damage

Forget old-fashioned alarms that no one hears — get direct SMS & email notifications, ensuring you catch leaks before they become a disaster.

Hope you never need it. Trust it when you do.

Compact (IP30)

For dry technical rooms, cabinets, and under sinks

Pro (IP67 waterproof)

For basements, plant rooms, and shafts

Examples of places we often detect damage first

- Technical shafts** — Where leaks often drip unseen down through several floors.
- Heating plant rooms** — Catch district-heating leaks and dripping pumps early.
- Elevator shafts** — Prevent sump water from damaging expensive lift equipment.
- Communal laundry rooms** — Behind industrial machines where pipes and hoses are rarely checked.
- Anywhere you need certainty** — Quick notification when unwanted water appears.

HOW ROOMALYZER PROTECTS

Early warning that reaches the right person.

Roomalyzer connects [Water detector](#) and [Water rope](#) sensors to give facility teams and housing associations instant alerts, reliable coverage in hard-to-reach spaces, and documentation that stands up in an insurance claim. [Compare leak sensors](#)

SMS & EMAIL

Smart notifications

Unlike a beeper-only sensor in an empty basement, Roomalyzer sends the alarm directly to the people who can act — by SMS and email the moment water is detected.

ESCALATION

Alarm escalation

Define a call chain for each site. If the first person does not acknowledge the alarm, the system automatically notifies the next contact — so a leak at 2 a.m. does not wait for someone to check their phone later.

THE RISK YOU CANNOT HEAR

A beeping sensor in an empty basement is not protection.

Leaks discovered too late

Water reaches servers, electrical installations, or the building fabric before anyone is aware — turning a minor incident into a major one.

Alarms no one hears

A traditional sensor beeps to itself in a basement or shaft where no one is around to notice it.

Hard-to-reach risk points

Shafts, basements, and technical rooms are exactly where leaks start — and exactly where no one looks regularly.

Operations teams that need to act fast

The same alert that reaches a facility manager in a commercial building reaches the on-call caretaker in a housing association — with documentation everyone can trust.

For facility managers and operations teams

- ✓ Get alerts sorted by criticality across sites
- ✓ Cover shafts, plant rooms, and technical spaces without Wi-Fi
- ✓ Document incidents for insurance and compliance

For housing and real estate

- ✓ Reach on-call caretakers by SMS — even when nobody is on site
- ✓ Protect basements, laundry rooms, and common technical areas
- ✓ Give board and insurers a clear record of when and where water was detected

ALSO RELEVANT

Heritage buildings face a double risk: slow humidity damage to collections and sudden water ingress from roofs, pipes, and masonry. Pair water detection with Preservation to protect both the fabric and what it holds.
